

## **LOW CARBON**

**Any producer of wires in low carbon is first and foremost looking for the possibility to let important tonnages run on his line while having a concept of line that is minimizing the functioning and maintenance costs, the margin on these products being reduced and dependent on the quantity.**

**FIB has of course the whole range of products related to the continuous annealing or the annealing in bell furnaces.**

**Within the particular framework of the energy consumption we offer, for diameters superior to 1,2 mm, a solution in open fire that has the enormous advantage of consuming two times less energy by ton of wire than the solutions in fluidised bed, what is ensuring an extremely rapid payback.**

**Many European and South-American customers have opted for this simple and particularly profitable technology !**

**Lastly, our technology of fluidised bed with total combustion is making it possible to put all the power in the sand as no flame is coming out of the fluidised bed !**

**One more reason for choosing FIB !**
